Question:

Find the value of y for which the distance between the points $\mathbf{P}(2, -3)$ and $\mathbf{Q}(10, y)$ is 10 units.

Solution:

Given the points,

$$\mathbf{P} = \begin{pmatrix} 2 \\ -3 \end{pmatrix} \quad \mathbf{Q} = \begin{pmatrix} 10 \\ y \end{pmatrix} \quad (1)$$

The distance between the points P and Q is given as,

$$d = \|\mathbf{P} - \mathbf{Q}\| = 10 \quad (2)$$

(3)

We know that, the length of a vector is defined as

$$\|\mathbf{P} - \mathbf{Q}\| \triangleq \sqrt{(\mathbf{P} - \mathbf{Q})^\top (\mathbf{P} - \mathbf{Q})} \quad (4)$$

$$(\mathbf{P} - \mathbf{Q})^\top (\mathbf{P} - \mathbf{Q}) = \|\mathbf{P} - \mathbf{Q}\|^2 \quad (5)$$

$$(\mathbf{P} - \mathbf{Q})^\top (\mathbf{P} - \mathbf{Q}) = 10^2 \quad (6)$$

(7)

$$\therefore \mathbf{P} - \mathbf{Q} = \begin{pmatrix} 2 \\ -3 \end{pmatrix} - \begin{pmatrix} 10 \\ y \end{pmatrix} = \begin{pmatrix} -8 \\ -3 - y \end{pmatrix}, \quad (8)$$

$$\Rightarrow \begin{pmatrix} -8 \\ -3 - y \end{pmatrix}^\top \begin{pmatrix} -8 \\ -3 - y \end{pmatrix} = 10^2 \quad (9)$$

$$\Rightarrow \begin{pmatrix} -8 & -3 - y \end{pmatrix} \begin{pmatrix} -8 \\ -3 - y \end{pmatrix} = 100 \quad (10)$$

$$\Rightarrow 8^2 + (3 + y)^2 = 100 \quad (11)$$

$$\Rightarrow (3 + y)^2 = 36 \quad (12)$$

$$\Rightarrow 3 + y = \pm 6 \quad (13)$$

$$\Rightarrow y = 3, -9 \quad (14)$$

Therefore the points $(10, 3)$ and $(10, -9)$ are at a distance of 10 units from the point P.
