### Question

Represent graphically a displacement of 40 km,  $30^\circ$  west of south.

### Solution (Matrix Method)

**Coordinate convention.** Let the  $x$ -axis point *East* and the  $y$ -axis point *North*. Thus:

$$\text{East} \equiv +x, \quad \text{West} \equiv -x, \quad \text{North} \equiv +y, \quad \text{South} \equiv -y.$$

**Rotation matrix.** For a counterclockwise rotation by an angle  $\theta$ , use

$$R(\theta) = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix}.$$

**Direction setup.** The unit direction for *South* is the column matrix

$$\mathbf{s} = \begin{bmatrix} 0 \\ -1 \end{bmatrix}.$$

“ $30^\circ$  west of south” means rotate the south direction *towards west* by  $30^\circ$ . this is a *anti-clockwise* rotation of  $330^\circ$ ,

Hence the required unit direction column is

$$\mathbf{u} = R(330^\circ) \mathbf{s} = \begin{bmatrix} \cos 330^\circ & -\sin 330^\circ \\ \sin 330^\circ & \cos 330^\circ \end{bmatrix} \begin{bmatrix} 0 \\ -1 \end{bmatrix} = \begin{bmatrix} -\sin 30^\circ \\ -\cos 30^\circ \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} \\ -\frac{\sqrt{3}}{2} \end{bmatrix}.$$

**Displacement column.** With magnitude 40 km, the displacement (as a  $2 \times 1$  matrix) is

$$\mathbf{d} = 40 \mathbf{u} = 40 \begin{bmatrix} -\frac{1}{2} \\ -\frac{\sqrt{3}}{2} \end{bmatrix} = \begin{bmatrix} -20 \\ -20\sqrt{3} \end{bmatrix} \text{ (km)}.$$

So the endpoint relative to the origin is

$$(x, y) = (-20, -20\sqrt{3}) \text{ km},$$

which lies in the third quadrant (west and south components), consistent with the description.
