Question: Let k be an integer such that the triangle with vertices

$$\mathbf{A} = \begin{pmatrix} k \\ -3k \end{pmatrix}, \quad \mathbf{B} = \begin{pmatrix} 5 \\ k \end{pmatrix}, \quad \mathbf{C} = \begin{pmatrix} -k \\ 2 \end{pmatrix}$$

has area 28 sq. units. Find the orthocenter of the triangle.

Solution:

$$\text{Area} = \frac{1}{2} |\mathbf{M}| = 28 \quad (0.1)$$

$$\text{where } \mathbf{M} = (\mathbf{B} - \mathbf{A} \quad \mathbf{C} - \mathbf{A}) = \begin{pmatrix} 5-k & -2k \\ 4k & 2+3k \end{pmatrix} \quad (0.2)$$

$$\det(\mathbf{M}) = (5-k)(2+3k) - (-2k)(4k) = 10 + 13k + 5k^2 \quad (0.3)$$

$$10 + 13k + 5k^2 = \pm 56 \quad (0.4)$$

After solving,

$$k = 2 \quad (0.5)$$

$$\text{For } k = 2, \quad \mathbf{A} = \begin{pmatrix} 2 \\ -6 \end{pmatrix}, \quad \mathbf{B} = \begin{pmatrix} 5 \\ 2 \end{pmatrix}, \quad \mathbf{C} = \begin{pmatrix} -2 \\ 2 \end{pmatrix} \quad (0.6)$$

The equation of the altitude through $\mathbf{A}$ is:

$$\mathbf{n}^T \mathbf{x} = 1 \quad (0.7)$$

This altitude passes through $\mathbf{A}$, so

$$\mathbf{n}^T \mathbf{A} = 1 \quad (0.8)$$

$$\mathbf{n}^T \begin{pmatrix} 2 \\ -6 \end{pmatrix} = 1 \quad (0.9)$$

and the direction vector $\mathbf{n}$ of the altitude is perpendicular to $\mathbf{B} - \mathbf{C}$:

$$\mathbf{n}^T (\mathbf{B} - \mathbf{C}) = 0 \quad (0.10)$$

$$\mathbf{n}^\top \begin{pmatrix} 7 \\ 0 \end{pmatrix} = 0 \quad (0.11)$$

The augmented matrix is:

$$\left(\begin{array}{cc|c} 7 & 0 & 0 \\ 2 & -6 & 1 \end{array} \right) \quad (0.12)$$

Row reduction steps:

First, $R_2 \rightarrow R_2 - \frac{2}{7}R_1$:

$$\left(\begin{array}{cc|c} 7 & 0 & 0 \\ 0 & -6 & 1 \end{array} \right) \quad (0.13)$$

$$\mathbf{n} = \begin{pmatrix} 0 \\ -\frac{1}{6} \end{pmatrix} \quad (0.14)$$

The equation of the altitude through $\mathbf{B}$ is:

$$\mathbf{n}^T \mathbf{x} = 1 \quad (0.15)$$

This altitude passes through $\mathbf{B}$, so

$$\mathbf{n}^T \mathbf{B} = 1 \quad (0.16)$$

$$\mathbf{n}^\top \begin{pmatrix} 5 \\ 2 \end{pmatrix} = 1 \quad (0.17)$$

And the direction vector $\mathbf{n}$ of the altitude is perpendicular to $\mathbf{A} - \mathbf{C}$:

$$\mathbf{n}^T (\mathbf{A} - \mathbf{C}) = 0 \quad (0.18)$$

$$\mathbf{n}^\top \begin{pmatrix} 4 \\ -8 \end{pmatrix} = 0 \quad (0.19)$$

The augmented matrix is:

$$\left(\begin{array}{cc|c} 5 & 2 & 1 \\ 4 & -8 & 0 \end{array} \right) \quad (0.20)$$

Row reduction steps:

First, $R_2 \rightarrow R_2 - \frac{4}{5}R_1$:

$$\left(\begin{array}{cc|c} 5 & 2 & 1 \\ 0 & -\frac{48}{5} & -\frac{4}{5} \end{array} \right) \quad (0.21)$$

Next, $R_2 \rightarrow -\frac{5}{48}R_2$:

$$\left(\begin{array}{cc|c} 5 & 2 & 1 \\ 0 & 1 & \frac{1}{12} \end{array} \right) \quad (0.22)$$

Back substitute: $R_1 \rightarrow R_1 - 2R_2$

$$\left(\begin{array}{cc|c} 5 & 0 & \frac{5}{6} \\ 0 & 1 & \frac{1}{12} \end{array} \right) \quad (0.23)$$

$$\mathbf{n} = \begin{pmatrix} \frac{1}{6} \\ \frac{1}{12} \end{pmatrix} \quad (0.24)$$

First altitude:

$$\begin{pmatrix} 0 & -\frac{1}{6} \end{pmatrix} \mathbf{x} = 1 \quad (0.25)$$

Second altitude:

$$\begin{pmatrix} \frac{1}{6} & \frac{1}{12} \end{pmatrix} \mathbf{x} = 1 \quad (0.26)$$

Combining both equations:

$$\begin{pmatrix} 0 & -\frac{1}{6} \\ \frac{1}{6} & \frac{1}{12} \end{pmatrix} \mathbf{x} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \quad (0.27)$$

Writing the augmented matrix:

$$\left(\begin{array}{cc|c} \frac{1}{6} & \frac{1}{12} & 1 \\ 0 & -\frac{1}{6} & 1 \end{array} \right) \quad (0.28)$$

Perform the row operation $R_1 \rightarrow R_1 + \frac{1}{2}R_2$:

$$\left(\begin{array}{cc|c} \frac{1}{6} & 0 & \frac{3}{2} \\ 0 & -\frac{1}{6} & 1 \end{array} \right) \quad (0.29)$$

Therefore, the solution vector is:

$$\mathbf{x} = \begin{pmatrix} 9 \\ -6 \end{pmatrix} \quad (0.30)$$

Answer: The orthocentre of the triangle is

$$\boxed{\mathbf{x} = \begin{pmatrix} 9 \\ -6 \end{pmatrix}}$$
